Hong Kong - Art Auction Via Videoconference

By: Keith Cameron 19940503 Press Contact: Caroline Chung,

Newsbytes

05/04/94 3 pages (480 words)

TAI KOO SHING, HONG KONG, 1994 MAY 4 (NB) -- Asian art lovers will gather in Hong Kong and Singapore this week for a unique event - Asia's first international fine art auction to use live video.

Around 600 collectors are expected to participate in the three-day Sotheby's Chinese art auction, which will use videoconferencing technology from Hongkong Telecom CSL to bring the excitement of a Hong Kong auction room to participants in Singapore.

"Hong Kong continues to be the main center for Chinese art-collecting in Asia, but there is growing interest in Singapore," said Julian Thompson, chairman of Sotheby's Asia. "In the past we have linked the two centers with a voice line for bidding but videoconferencing will enable collectors in Singapore to capture the atmosphere in Hong Kong. It's a very exciting development."

In Hong Kong, a camera at the rear of the hall will alternate between views of the auctioneer and large objects under sale, while a high resolution document camera will be used to transmit still images of smaller objects and transparencies of paintings. Using Hongkong Telecom CSL's VideoNet service, the images will be transmitted simultaneously to two 27-inch TV monitors in the Singapore auction room.

"With larger objects, we will be able to zoom, turn, and pan in and out to give participants in Singapore a real-time perspective," said Tony Dickel, director of finance and operations for Asia, who was instrumental in setting up the project. "Smaller objects transmitted by the document camera will be visible all the time, so the Singapore audience can watch the auctioneer taking bids without losing sight of the item on sale."

While the Singapore audience will be able to view the action in Hong Kong, only the Hong Kong auctioneer will have a view of the bidding in Singapore. There will be no close-ups of individuals at either center.

Sotheby's, the world's oldest and largest fine art auction house, is now exploring the possibility of using videoconferencing for initial appraisals by its London-based experts of items offered for sale or

valuation by Asian collectors.

"While a personal, hands-on inspection is often necessary, videoconferencing will enable our experts to make a preliminary judgement and decide whether an immediate trip to Asia is justified by the object's importance," noted Dickel.

Sotheby's will also evaluate videoconferencing as an alternative to some of its executives' routine business travel and, if this week's Hong Kong - Singapore sale is successful, will consider linking Taipei and other Asian capitals to Hong Kong for future auctions.

VideoNet is a facility that packages video communications equipment with network transport and consultancy services.

BOSTON TV STATION PLANS ONLINE AUCTION

Newsbytes

1/27/87 2 pages (140 words)

BOSTON (NB) -- Public television station WGBH will hold a four-day, online fund raising auction next month, according to BUSINESS WEEK. The station will sell off as many as 400 computer items, all donated, ranging from low-cost software packages to complete high-end PC systems. Bidders with computers and modems will be able to call the station and see descriptions of the items on screen. Bidders can keep bidding over the modem until the auction is over. Says auction manager Edythe Baker, "an on-line auction like this has never been done before that we know of, and we expect this kind of thing to grow." No word yet from WGBH on the telephone number. Stay tuned.

CONTACT: WGBH Television, Boston, Mass., 617-492-2777.

COMMERCE ON THE INTERNET

TEXT:

... money on the Internet, they don't move forward." And for some companies thinking of **selling** **goods** or services **online**, there are such tricky matters as figuring out how much to charge and how to collect from people who **buy** over the Internet.

Not Something You Just Tap Into

The Internet is the ultimate laissez-faire marketplace. Think...

... for businesses in terms of real content?" asks Bill Washburn, executive director of the Commercial **Internet** Exchange (CIX), a **trade** group that has made it easier for companies to conduct business on the Internet. "I... Alain Pinel created a cheap but effective wide-area Internet with its partners. Agents send **escrow** information back and forth to local title companies over the Internet. Eager for Alain Pinel... its Internet travelers. Survival is its motive. Faced with cuts in defense spending, the defense **contractor** has had to watch costs and find new opportunities. Two years ago, Lockheed, already a...

...at corporate headquarters in Calabasas, Calif.

Several architectures were evaluated. But Carroll says the defense **contractor** "honed in on Internet-like communication" because they "already had a TCP/IP backbone in...primary concern is security," says Tom Nakamura, a senior scientist with Hughes Aircraft, a defense **contractor** known for working on classified projects. Hughes has both a T1 and a 56-kilobyte...

...documentation, and support.

Predictable Trips

Using frame-relay switching for the delivery of Internet packets **guarantees** high performance levels and may improve security. Frame-relay switching creates a fixed path between...

...that your data will pass through an insecure host.

Frame relay also enables companies to **guarantee** the performance between two offices by assigning a portion of their bandwidth to that connection...

Specialized Tools, Availability Spur Growth of OLTP

Brown, Kim

Computerworld v20n39 PP: 44-45 Sep 29, 1986 CODEN: CMPWAB ISSN:

0010-4841 JRNL CODE: COW

DOC TYPE: Journal article LANGUAGE: English LENGTH: 2 Pages

SPECIAL FEATURE: Graphs Diagrams

ABSTRACT: Tandem Computers Inc. and Stratus Computer Inc. have had excellent revenue and growth earnings over the past 2 years as a result of specialized product offerings designed to meet the needs of online transaction processing (OLTP) users. OLTP is the process of the real-time updating of a company's database, which allows a customer or employee to make a decision that may change the state of the business as a result of consulting the database. Such transactions have a distinct beginning and end and occur between an interactive terminal and host processor. A computer system must have either high **availability** or be fault-tolerant to be considered for an OLTP application. **Availability** includes such key elements as **reliability**, **vendor** system support, **online** expandability, applications, and **product availability**. Most **vendors** in the OLTP market have chosen one or a mixture of architectures that include: 1. monolithic mainframe, 2. minicomputers with systems-level fault tolerance, 3. hardware-only fault tolerance, and 4. UNIX-based systems.

Tours de Force

Travel Agent December 26, 1994 p. 80

ISSN: 1053-9360

STACEY ZABLE

Mary Stachnik, executive vice president of Mayflower Tours in Downers Grove, Ill., says that interest by agents in the escorted group travel market is increasing as they realize the need to book other segments of the industry.

'At ASTA in Portugal, it was the first time I felt the escorted group market was getting respect,' she says. 'Before, we'd talk about the market and they'd say fine and dandy, there's a certain clientele for it, but now they're asking me about this type of vacation. Now they're thinking it's a high-ticket item; it's very good commission and, in some cases, we price in air with one phone call. It's really exciting after many years of trying to get a piece of the pie.'

Arthur Tauck, president of Tauck Tours in Westport, Conn., adds that he knows an agent's job is a difficult one. 'The travel agent is selling the world - how do you get to know the world?'

What strategy should agents follow in booking tour products?

The way for agents to survive and prosper in the coming years is to find a specific niche and develop it, according to Richard Copland, CEO of Hillside Travel, which has locations in the metropolitan New York area. 'Travel agents need to think of their agencies like boutiques. If they want to sell \$2,000 dresses, (that's) OK, and if they want to sell \$18 dresses, OK, too. The key for individual travel agents is not to be afraid. Change is coming and they need to do other things - tours and cruises - to survive and prosper. The days of writing airline tickets and surviving on (them) are over - at least for the next few years. Agents must find a niche. To survive they must decrease their dependence on airline tickets; if they don't, they're destined for hard times,' Copland says.

Transaction Processing Moves To Users

Open Systems Today September 12, 1994 p. 48

ISSN: 1040-5038

By Kelly Jackson Higgins

At some Domino's Pizza restaurants, calling in a pizza order triggers a series of transactions that not only coordinates the preparation, delivery, and sale of the order - it also generates a coupon for the same type of pie.

Such a well-orchestrated series of events is becoming more commonplace in business these days as on-line transaction processing (OLTP) gradually moves closer to the user by way of client-server. Companies like Domino's now can more easily and quickly create custom applications for client-server OLTP that, for instance, use customers' buying patterns as an opportunity to drum up more business.

'Having OLTP move to the business unit is more effective, because it's closer to the actual users, who are most familiar with that application,' said Peter Burris, director of worldwide systems and server research for International Data Corp., Framingham, Mass. 'The goal is to make OLTP applications reflect the way a business behaves and how its activities are

conducted.'

The localized client-server approach to OLTP offers users more options in workstations, such as the graphical-user-interface-based PC, and lower support and start-up costs than the traditional centralized, mainframe-based OLTP. It also shortens the turnaround time for developing new applications.

A branch office of a bank, for example, can offer special services unique to its region, churning out an application of its own with client-server OLTP tools in a matter of days or weeks. Such an application could get lost in a mainframe-application backlog for months or even years.

User organizations are increasingly adding another layer of software, called the transaction processing (TP) monitor, to add a measure of reliability to these emerging distributed transaction systems. Because they are decentralized and often represent a mix of vendor products, client-server OLTP systems can pose a major management problem. That's where TP monitor software comes in, acting as a traffic cop to coordinate the transaction process.

TP monitor software is middleware that sits between the client and database machines. It typically comes with application programming interfaces that glue together the transaction and related applications, plus embedded security and backup functions that ensure the integrity of a transaction and the database.

ABSTRACT EP 637799 A2

A high performance shared cache 100 is provided to support multiprocessor systems and allow maximum parallelism in accessing the cache by the processors 3, servicing one processor request in each machine cycle, reducing system response time and increasing system throughput. The shared cache of the present invention uses the additional performance optimization techniques of pipelining cache operations (loads and stores) and burst-mode data accesses. By including built-in pipeline stages, the cache is enabled to service one request every machine cycle from any processing element. This contributes to reduction in the system response time as well as the throughput. With regard to the burst-mode data accesses, the widest possible data out of the cache can be stored to, and retrieved from, the cache by one cache access operation. One portion of the data is held in logic in the cache (on the chip), while another portion (corresponding to the system bus width) gets transferred to the requesting element (processor or memory) in one cycle. The held portion of the data can then be transferred in the following machine cycle. (see image in original document)

ABSTRACT EP 549325 A2

A method for implementing transaction-consistent resource recovery from catastrophic media failures in a single pass over a recovery log archive while permitting most UNDO log records to be discarded during log archiving. The media recovery procedure is based on a pseudo-crash recovery technique that simulates a system crash at a selected time by writing pseudo-recovery records to the recovery log. Resource recovery is then performed by normal execution of the log archive records up to the most recent pseudo-crash followed by execution of the subsequent pseudo-recovery records. The recovery log record execution procedures are based on the ARIES recovery method. One embodiment of this invention assumes that the recovery log records can be selected for archiving on the basis of a combination of record type and transaction identifier.

ABSTRACT EP 461792 A2

The system comprises a pair of error checking processors connected in a master/slave configuration such that the slave receives inputs and outputs of the master, mimics operation of the master based on the inputs to produce mimicked outputs, compares the mimicked outputs with the master outputs and indicates an error condition if the mimicked outputs do not equal the master outputs. A checking circuit forces a difference between the mimicked output and the master output and determines if the master slave configuration accurately determines the presence of the forced error.

ABSTRACT EP 476247 A1

A semiconductor storage system comprises a semiconductor storage element array (1) including a plurality of semiconductor memory elements, a data bus (2) for transferring data to said semiconductor storage element array, an address bus (4) for inputting an address to said

semiconductor storage element array, a read/write controller (5) for controlling read/write of the data written to said semiconductor storage element array, an interface control module (6) for controlling a transfer/receipt of data and commands to and from an outside system, a microprocessor (8) for generalization-controlling said read/write controller and said interface control module, a defect address memory (9) for storing and outputting information on an address where at least one defective bit exists and an alternate address to be alternated with said address, and a defect address manipulating circuit (12) for alternating said alternate address with said address where said defective bit exists in accordance with an output of said defect address memory. PROCESSORS';

ABSTRACT EP 405736 A2

The functions of two virtual operating systems (e.g. S/370 VM, VSE or IX370 and S/88 OS) are merged into one physical system. Partner pairs of S/88 processors run the S/88 OS and handle the fault tolerant and single system image aspects of the system. One or more partner pairs of S/370 processors are coupled to corresponding S/88 processors directly and through the S/88 bus. Each S/370 processor is allocated from 1 to 16 megabytes of contiguous storage from the S/88 main storage. Each S/370 virtual operating system thinks its memory allocation starts at address 0, and it manages its memory through normal S/370 dynamic memory allocation and paging techniques. The S/370 is limit checked to prevent the S/370 from accessing S/88 memory space. The S/88 Operating System is the master over all system hardware and I/O devices. The S/88 processors across the S/370 address space in direct response to a S/88 application program so that the S/88 may move I/O data into the S/370 I/O buffers and process the S/370 I/O operations. The S/88 and S/370 peer processor pairs to execute their respective Operating Systems in a single system environment without significant rewriting of either operating system. Neither operating system is aware of the other operating system nor the other processor pairs. (see image in original document)

ABSTRACT EP 221763 A2

In a system for transferring data between a host device and a target
recording medium, a buffer interface control unit includes a host direct
memory access (DMA) unit for transferring data from the host unit to a

buffer memory. The host DMA unit accesses a first set of prescribed noncontinuous buffer memory storage locations to store the data transferred from the host unit in a predetermined buffer format that includes additional sets of prescribed storage locations interspersed with the first set of data storage locations for the storage of error code characters pertaining to the data. The host DMA unit also transfers error correction code characters pertaining to the data to one of the additional sets of prescribed storage locations. The buffer interface control unit further includes a target DMA unit for transferring data from the buffer memory to a write interface unit. The target DMA unit accesses the buffer memory storage locations in a predetermined noncontinuous sequence in order to retrieve the data from the buffer memory in a format that includes open time slots interspersed with time slots occupied by the retrieved data for the insertion of error detection code characters pertaining to the data retrieved from the buffer memory.

GRADE: Product Analysis, No Rating

Sales of available native 32-bit Windows 95 applications are relatively strong, and will continue to spiral, say analysts and retailers. Microsoft Plus Pack sales are particularly strong, as are sales of Microsoft Office 95, Norton Utilities for Windows 95, and Norton AntiVirus, say retailers. A \$180 rebate offer boosted sales of Microsoft Office, and during the first two days after Windows 95's release, 30 percent of purchasers also bought the Microsoft Plus companion pack. Microsoft Plus Pack provides an **Internet** access kit, wallpaper, a compression utility, and a pinball game. **Sales** are also **good** for memory-boosting software that ups 4 MB RAM to 8 MB. Retailers, who must balance 16-bit and 32-bit application stock, say the transition to native Windows 95 applications will not be complete until the end of 1995; between 20 and 30 million Windows 95 packages should sell in 1995.
